*Acknowledgements.* The authors failed to acknowledge contributions from the following and would like to rectify that oversight. Thanks to David Crisp, George Mount, Stan Sander, and David Johnson for their advice on slit homogenizer optical design and expected effects as well as interpretation of the test data. Thanks also to the mechanical team at Lockheed Martin, led by Cathy Chou, for design of the prototype homogenizer devices. A great thanks is owed to Mathieu Fradet of JPL, who aided the team in selecting and procuring an appropriate 2.3  $\mu\text{m}$  laser for testing and traveled to ITO and helped with setting up the 2.0 and 2.3  $\mu\text{m}$  lasers.
