MIPAS ozone retrieval version 8: middle-atmosphere measurements

Manuel López-Puertas et al.

Correspondence to: Manuel López-Puertas (puertas@iaa.es)

This document serves as a reference for the definitions of the representative atmospheres used for the calculation of the middle atmosphere (MA) and upper atmosphere (UA) measurement modes ozone error budgets. The representative atmospheric conditions are listed in Tables S1 and S36. This document also collects the respective error budgets of both modes, which are listed in Tables S2–S35 for the MA data and in Tables S37–S70 for the UA data. The errors are also depicted in figures S1–S34 for the MA data and in figures S35–S68 for the UA data.

The errors are given as relative values in percentage, even if they are of additive nature, i.e., do not scale with the retrieved volume mixing ratio. They were calculated with respect to the average ozone profile calculated from the single geolocations contributing to the respective representative atmospheres.

S1 Errors budget for O_3 MA data

In this section we provide the errors for the MA data.

Table S1. Labels and definitions of the representative atmospheric conditions which were used to calculate the error budget for MA data.
