I read this paper with interest; the measurements offered by POLDER/PARASOL have great potential for the improvement of aerosol remote sensing, and it is good to see such a scheme making use of their high information content.

I did have one comment, regarding Figure 3 (page 5060). It looks like the left and right parts are the same, while if I have understood correctly, the right-hand side should

C2056

illustrate lognormal size bins: was an incorrect figure inserted here?
