On differentiating ground clutter and insect echoes from Doppler weather radars using archived data by S. Rennie, A. Illingworth and S. Dance.

The proposed paper has not the level of a journal paper. At this stage it cannot be accepted for publication in AMT. Therefore major revisions must be done and the authors should submit another extended version of their paper. A method to differentiate ground clutter and insect echoes using archived data is proposed. The method is not assessed in the paper, but only illustrated on one example. That is the major problem of the paper.
