Three anonymous reviewers state in unison that the manuscript 'Preliminary observation of temperature profiles by radio acoustic sounding system (RASS) with a 1,280 MHz Lower Atmospheric Wind Profiler at Gadanki, India' is not publishable in its current form. Based on the outcome of the anonymous review process, especially the request to substantially increase the available database and extend the discussion, I think it will take a long time and require a huge effort to work on the reviewers comments to

C2460

produce a revised version of the manuscript that is publishable in AMT. Furthermore the authors comments indicate that the scientific substance of the data provided in the manuscript might be out of the scope of the AMT journal. Based on the foregoing I do not encourage the submission of a revised draft.
