Review of: Vertical profile of δ 18000 from middle stratosphere to lower mesosphere derived by retrieval algorithm developed for SMILES spectra

By Sato et al. Atmos. Meas. Tech. Discuss., 6, 8889-8935, 2013

General comments

This paper does a nice job of describing a well-performed project involving the development, characterization and interpretation of a retrieval of geophysical information from the SMILES instrument, optimized for measurement of ozone isotopes and ozone

isotopic ratios. The work has been performed in what appears to be a robust manner, and the results have been well characterized and likely to be robust.

I am confident this paper will merit publication in AMT, though I do have some minor comments for the authors to address/consider. The standard of English is generally good. I have pointed out a few places where better wording is possible. However a pass through by a copy editor would probably improve it further. The figures are generally very clear, though, again, I do have some minor suggestions for improvements.

—- Title

Suggest "... from *the* middle ... derived *using* a retrieval ..."

—- Abstract

Line 4/5: "...algorithm specific for the isotopic..." is unclear and clumsy wording. Does it mean you're retrieving the isotope ratio as a state vector element, or, more simply, that this whole retrieval system is geared towards retrievals of isotopic species?

Line 14: Add comma after "agreement"

Line 16/17: Reword to "The delta18000 peak, of 18%, is located at the stratopause"

Line 20: suggest "... wide *altitude* range ..."

— Page 8891

Line 8: Not sure that "trend" is the right word here, as it's altitude not time we're considering. I suggest "behavior" instead.

Line 18: "Using spectroscopic techniques, aymmetric..."

--- Page 8892

Line 10: "the importance of photochemistry..." Not sure what this is trying to say, was it a surprise that photochemistry was important? Surely everyone would have expected that. Was there something specific about the photochemistry that was important?

Line 14: Suggest "...low-noise spectra, enabling observations at high altitudes with good signal to noise."

—- Page 8893

Line 3: "spectrum" -> "spectral"?

Line 5: "above the middle stratosphere" -> "in the middle stratosphere and higher" (or do you really mean to exclude the middle stratosphere?)

Line 21: Consider changing "functions" to "model"?

--- Page 8894

Line 5/6: Fuse two sentences to give: "...after correcting it by a bias offset estimated by comparing ..."

Line 12-14: Not sure this last sentence adds anything, consider deleting.

Line 16: suggest "As mentioned in Sect. 1, only two of the three bands can be simultaneously observed..."

Line 19: suggest adding comma after "study"

Line 20/21: "depending on the other band" - this discussion feels unclear, at least to me.

--- Page 8895

Line 1-2: I actually don't understand why "retrieving the VMRs of O3 and 18OOO with different weights due to the difference of the spectral line intensities" would be a problem? Why do you not want to do this. A more detailed explanation and motivation here would help.

C3843

Line 5: suggest moving "were" to after "retrieved"

Line 6-7: suggest "the spectrum..." -> "a first-order polynomial representing a spectral baseline"

Line 13-14: suggest "spectral" rather than "spectrum"

Line 17: again "spectrum" -> "spectral"?

--- Page 8896

Line 14-16: Took me a while to realize you're talking about accounting for the movement of the antenna during integrations. Consider rewording along those lines. Just calling it a "widening" doesn't make it clear where it's coming from.

--- Page 8897

Equation 2: Your definition of chi-squared is unconventional, as you point out. If you'd wanted to weight the a priori more, why not simply have a tighter a priori covariance matrix? Furthermore, it's not clear that your retrieval is really minimizing this chi-squared. If it were, I would have expected to see 1/nx and 1/ny terms in equation 13. If it is truly equation 13 you're using to arrive at the solution, then I would contend that you've found the minimum in the conventional chi-squared (i.e., the one without the division by nx and ny). Please clarify this discussion. If indeed there are additional 1/nx 1/ny terms lurking about in the algebra, have you checked that they don't extend to things like the averaging kernels also.

--- Page 8898

Line 6: Not sure what "dispersion" means in this case, would "divergence" be better?

--- Page 8900

Equation 13: So, the Gamma, Marquardt-Levenberg parameter doesn't change from iteration to iteration then? That seems quite unconventional to me. Is the retrieval really

that non linear that you have to use such an unconventional approach to reach your solution. Granted, if the chi-squares are good, then the solution is probably a perfectly good one, even if you got there a round about way.

--- Page 8901

Line 27: "... conservatively estimated as being twice the size of those for the O3 line, considering..."

—- Page 8902

Line 26: "for obtaining" -> "in order to obtain the isotopic ratio without recourse to any vertical..."

--- Page 8903

Line 12: Suggest "This is because of" -> "This improvement derives from"

—- Page 8904

Line 1: "might" is weak here, surely that would be easy enough to check and verify for

Line 24: "We encourage determining" is clumsily worded. How about "We recommend that a laboratory study be undertaken to determine"

Line 28: "overcame" -> "overcome"

--- Page 8905

Line 16: What do you mean by "comparable" here? Was it that roughly the same fraction of points were rejected?

Line 18: This kind of filtering can be dangerous (TOMS ozone hole etc.) Could you at least say how many points were rejected by this filter? Did they still have reasonable chi-squares?

C3845

--- Page 8906

Line 17: At 28km - what about lower altitudes, or are there no data produced lower

Line 18: At 57km - what about higher altitudes, or are there no data produced above that altitude?

--- Page 8906

Line 18: suggest "a significant" before "temperature dependence"?

Line 24-25: The sentence "We also discuss" is clumsily worded

--- Page 8911

Line 16: suggest "trends" -> "behavior" as trends is typically thought of as being time related.

--- Figure 1

Caption: For last sentence suggest: "Green, red and blue shading represent the b1, b2 and c1 frequency windows, respectively."

—- Figure 2

Not sure that having symbols on the lines really adds anything. Consider removing them to make the plots less cluttered. Also, I suspect the fonts are a bit small.

--- Figure 3

Again, not sure the symbols add anything.

--- Figure 4

The last sentence in the caption is unclear (at least to me). Do you mean divergence rather than dispersion? Also, does "which is the same" really mean "as for"?

--- Figure 5

The overlapping shadings are a little hard to distinguish, though not impossible. Might showing error bars be clearer? It would probably be more cluttered though, so what you have here may be OK.

--- Figure 7

Suggest showing a larger y-range, to at least take in the error bars for the averages, if not every point. Also, consider using darker colors for the points, they're too light to see clearly on my screen.

--- Figure A1

Again, symbols don't add much, fonts too small.

--- Figure A2

Again, consider dropping symbols

--- Figure A4

Same comment on shading as for Figure 5.

--- Figure A5

Again, font size and need for symbols.
