I consider this manuscript very interesting. It focuses on the GNSS water vapour derived products applications. Nowadays GNSS estimated IWV or PW are one of data assimilated in the Numerical Weather Models for the meteorology forecast. These products have demonstrated a high accuracy and they are becoming useful in other applications. For their development it is necessary the collaboration among the Geodesy organizations and the meteorologic ones and in this context SUADA can help for the development of new applications for the GNSS estimated water vapour products.
