

Interactive comment on “Benefit of depolarization ratio at $\lambda = 1064$ nm for the retrieval of the aerosol microphysics from lidar measurements” by J. Gasteiger and V. Freudenthaler

J. Gasteiger and V. Freudenthaler

josef.gasteiger@lmu.de

Received and published: 11 September 2014

Please revise the presentation and language of your work, including more information about inversion theory and lidar technique, in order to put your work in a better context for the reader that is not familiar with these methods.

We revised the manuscript such that it is more easy to read and contains more information for readers not familiar with the methods. We added a flow chart which illustrates our approach.
