## Interactive comment on "A better understanding of POLDER's cloud droplet size retrieval: impact of cloud horizontal inhomogeneity and directional sampling" by H. Shang et al.

shanghz@irsa.ac.cn Received and published: 13 October 2015 Dear Dr. B. van Diedenhoven, I agree with your suggestion with respect to the calculation of the effective radius and variance for mixtures of gamma distributions. I have read the article (Alexandrov et al., 2012) that you have mentioned, I am still not clear how to calculate the combined gamma effective radius and variance. Could you please tell me which formulas are used? Thank you very much! Yours sincerely, C3260
