

Interactive comment on “Measurement of wind profiles by motion-stabilised ship-borne Doppler lidar” by P. Achtert et al.

P. Achtert et al.

p.achtert@leeds.ac.uk

Received and published: 30 October 2015

We thank the reviewers for their constructive criticism and helpful comments. We introduced the following general changes to the manuscript:

- The discussion of the results now includes the standard deviation, bias and rmse for the comparison of measurements with lidar and radiosonde.
- The comparison to the flux tower wind measurements has been omitted as one reviewer thought it unnecessary to convey the message of the manuscript.
- We added a measurement case that presents our combined data set from measurements with ceilometer and Doppler wind lidar in combination with soundings.
