

Interactive comment on “GOMOS bright limb ozone data set” by S. Tukiainen et al.

Dr. Rahpoe (Referee)

nabiz@iup.physik.uni-bremen.de

Received and published: 10 February 2015

The manuscript presented, deals with a new ozone data set which is very useful for the ozone community.

Overall the paper is well written and the reader has less difficulty to follow the line of argumentation. I have only minor comments. I would add more text in the conclusion part if possible.

Minor comments:

133: (Omit the full link in the text) Only refer it, and put the full link as the reference

151: than is used → that is used

174: Why $\chi^2 > 10$? (Any optimization method used to use this value? How about DOF

C67

and reduced χ^2 ?)

221: Put it as an equation or in a table
