

Section S1: Detection limits and sampling times

Figure S1. The percentage of HOA and OOA measurement samples below detection limit as a function of the sampling interval $\Delta\tau$. Detection limits are defined as 3 times the constant error term expressed as a concentration ($\sigma_{\theta,c}$).

Section S2: Additional sequential sampling results

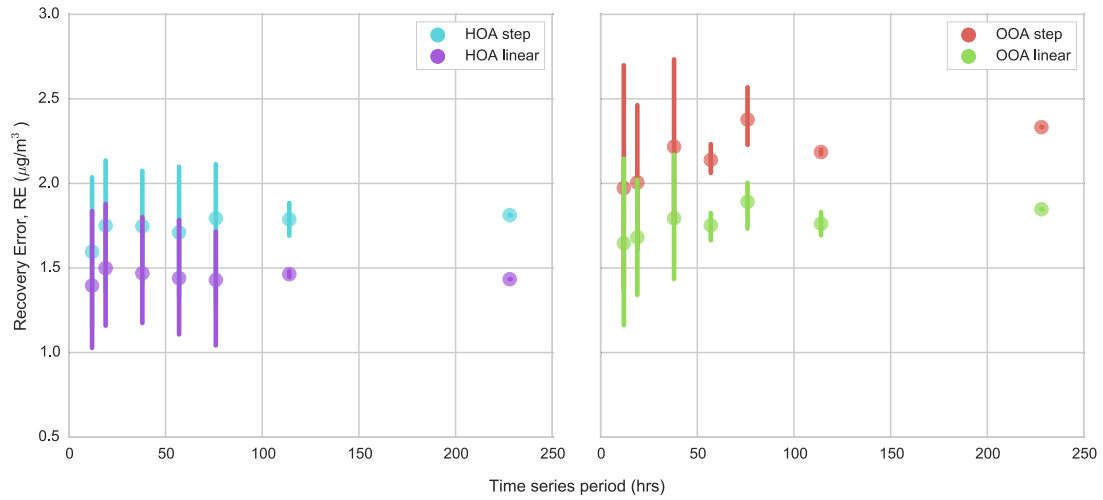

Figure S2. Mean Recovery error (RE) as a function of the time series period T for HOA and OOA time series constructed by step and linear interpolation between sequential measurements of length ($\Delta\tau$) 4 hours. $\kappa_m = 20\%$. The vertical bars represent 95% confidence intervals determined by bootstrapping the mean estimates.

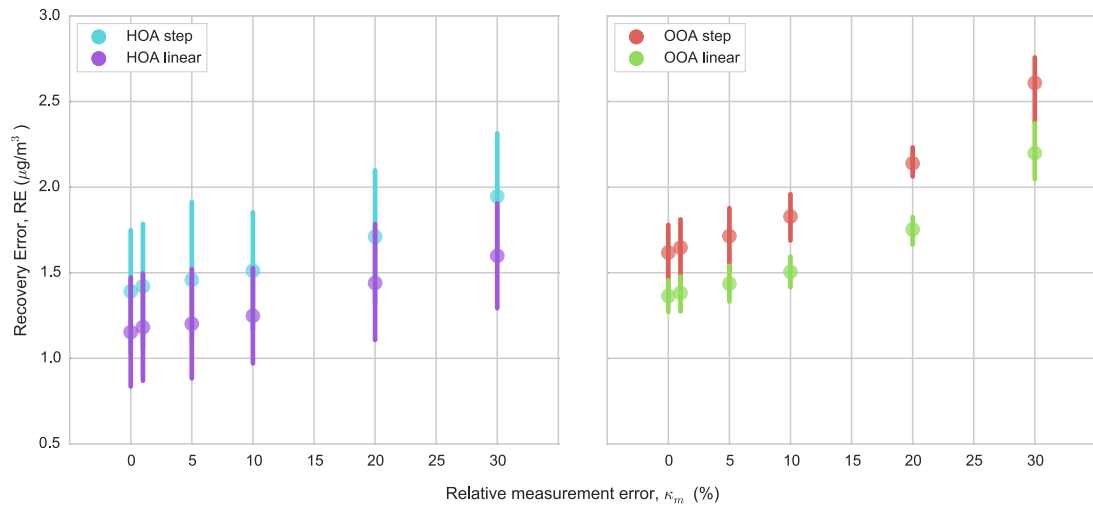

Figure S3. Mean Recovery error (RE) as a function of the relative measurement error κ_m for HOA and OOA time series constructed by step and linear interpolation between sequential measurements of length ($\Delta\tau$) 4 hours. $T = 57$ hours, meaning each data point is an average over 4 ($=228/57$) time series segments. The vertical bars represent 95% confidence intervals determined by bootstrapping the mean estimates.

Section S3: Additional deconvolution results

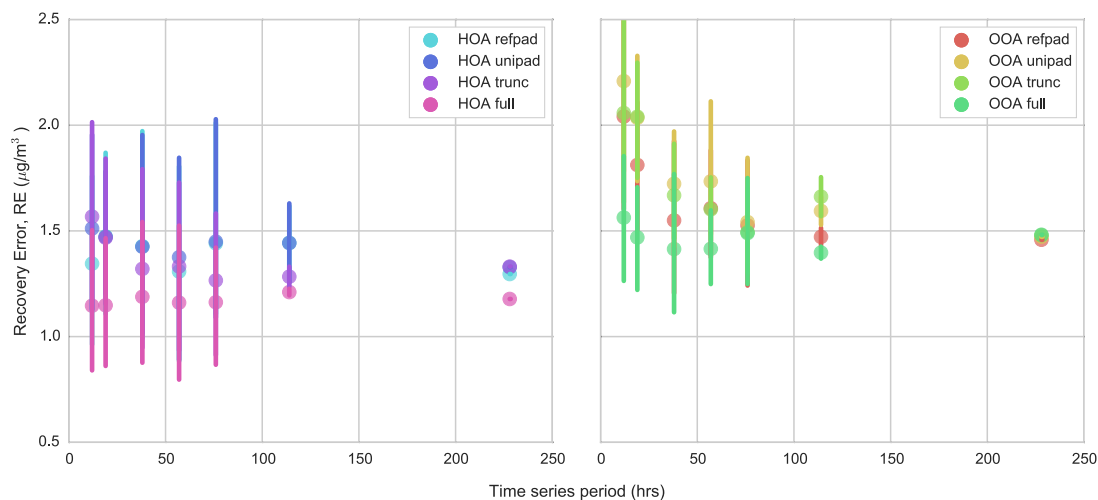

Figure S4. Mean Recovery error (RE) as a function of the time series period T for HOA and OOA time series constructed by deconvolution with TSVD regularization of staggered measurements of length ($\Delta\tau$) 4 hours. $\kappa_m = 20\%$. The boundary value methods are full; trunc, truncated; unipad, uniformly padded; and reypad, reflectively padded. The vertical bars represent 95% confidence intervals determined by bootstrapping the mean estimates.

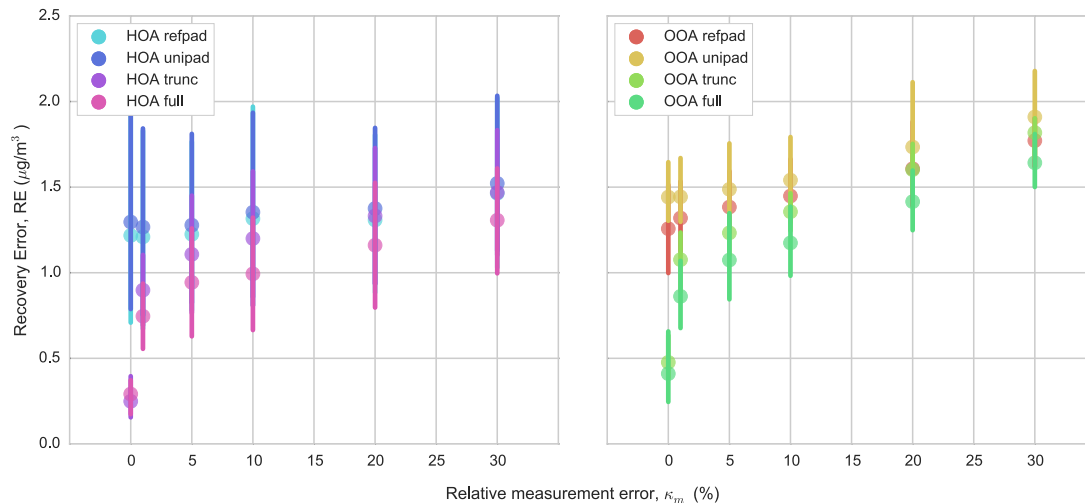

Figure S5. Mean Recovery error (RE) as a function of the relative measurement error κ_m for HOA and OOA time series constructed by deconvolution with TSVD regularization of staggered measurements of length ($\Delta\tau$) 4 hours. $T = 57$ hours, meaning each data point is an average over 4 ($=228/57$) time series segments. The boundary value methods are full; trunc, truncated; unipad, uniformly padded; and reypad, reflectively padded. The vertical bars represent 95% confidence intervals determined by bootstrapping the mean estimates.
