

***Interactive comment on “Evidence of a significant rotational non-LTE effect in the CO<sub>2</sub> 4.3 μm PFS-MEX limb spectra” by Alexander A. Kutepov et al.***

**Anonymous Referee #2**

Received and published: 7 October 2016

The authors present a very interesting analysis of evidence of rotational non-LTE in the Martian upper atmosphere CO<sub>2</sub> 4.3 μm daytime emission, with a nice explanation of the redistribution of SH band intensities from the line cores to the wings.

The authors should include in the paper the non-LTE rotational temperature and kinetic temperature at the tangent heights of the synthetic LOS radiation calculations.

LOS radiance simulations were conducted with and without line overlap. Does the ALI-ARMS code include line overlap (within the bands and between lines of different bands) in computing the ro-vibrational level populations? If not, how might line overlap in computing the ro-vibrational levels alter the simulated LOS radiance?

C1

The written quality of the paper is not bad, but the grammar could be improved.
