

Review of the revised paper: Treadaway et al

For this version of the paper the authors have taken all my comments into account. The organization of the paper and the figures are much improved. The uncertainty in the glycolaldehyde is the weakest part of the paper, but I don't think this can be improved in this paper. A good calibration for GA is a research project on its own. So I don't have any further comments and the paper can now be accepted as is.
