

Interactive comment on “Screening for Snow/Snowmelt in SNPP VIIRS Aerosol Optical Depth Algorithm” by Jingfeng Huang et al.

Anonymous Referee #1

Received and published: 18 June 2018

This manuscript reports a development of an algorithm that effectively screens out snow/melting snow pixels in SNPP VIIRS aerosol optical depth product. The algorithm is described in details. Comparisons with AERONET measurements show that the algorithm works to effectively remove the snow and snow-melting pixels in the aerosol product. The paper is well written. Figures are sufficient and in general have good quality. Outcome of the study is of great importance to scientific studies that use the VIIRS aerosol product. I recommend the paper be published in the journal of AMT, before a few minor revisions are done.

1. While the "aerosol optical depth" (AOD) is used in title. the "aerosol optical thickness" (AOT) is used in abstract and main text. Although AOD and AOT have been used interchangeably in literature for quite a while, I would suggest a consistent use of

C1

terminology throughout the paper. Furthermore, I prefer to use AOD.

2. Figure 4 has low quality, although other figures have good quality. Also, three panels appear to have the same title, which is a bit confusing. I would like to suggest that they re-plot the figure with high quality. For panel (c), a different color scale may be used to better represent the difference.

3. abstract, line 21: VRA appears too abruptly without any explanation. It may be suffice to say just the "default" snow-removing algorithm.

4. page 2, line 72: add "snow" immediately before "contamination".
