

## ***Interactive comment on “Atmospheric bending effects in GNSS tomography” by Gregor Möller and Daniel Landskron***

### **Anonymous Referee #1**

Received and published: 14 August 2018

#### General comments:

The paper studies bending effects in GNSS tomography. I recommend to consider the paper for publication. However, the following points must be addressed.

#### Specific comments:

(1) I recommend to rewrite the 'Introduction'. The section 'Introduction' must be more general. In the 'Introduction' there is no need for technical details and formulas. Technical details and formulas must be provided in the following section (see next point). Instead, provide a brief overview on the state of the art in tomography. Provide some relevant references, e.g. Bender et al., 2011, Champollion et al., 2005, Hirahara, 2000, and their findings. In all the above mentioned works bending effects were ig-

Discussion paper

nored. Therefore you should then provide references where bending effects are taken into account. Here you should mention Zus et al (2015) (not cited in the manuscript) and a paper that appeared two years later Aghajany and Amerian (2017) (cited in the manuscript).

(2) Section 1 ('Introduction') and 2 ('Atmospheric bending effects in GNSS signal processing') need a complete makeover. I suggest to merge the two sections to one section with the following title 'Atmospheric bending effects and WV tomography'. To my understanding you are concerned with SWDs and not STDs. In short, I recommend the following structure for this section:

### 2.1 Atmospheric bending effects

Here you should at first introduce the basic observable, i.e., STDs. You can either use eq 2 or 10. They are essentially the same. I recommend to use eq 2. Hence, you start as follows: The STD is defined as (Bevis et al. 1992)

$$\text{STD} = \int n \, ds - g$$

n...index of refraction s...arc length of bent ray-path (refer to section 3) g...geometric distance between satellite and station

Then, you introduce refractivity N. In essence

$$n = 10^{(-6)} N + 1$$

and therefore

$$\text{STD} = \int 10^{(-6)} N \, ds + s - g$$

Then you introduce the hydrostatic and wet refractivity

$$N = N_h + N_w$$

and therefore

$$\text{STD} = \int 10^{(-6)} N_h \, ds + s - g + \int 10^{(-6)} N_w \, ds$$

Next, you introduce the following quantities

$$\text{SHD} = \int 10^{(-6)} N_h ds + s - g$$

and

$$\text{SWD} = \int 10^{(-6)} N_w ds$$

such that

$$\text{STD} = \text{SHD} + \text{SWD}$$

At this point it is again important to mention that the ray-path (and therefore the arc-length  $s$ ) depends on the 'total' refractivity  $N$  (refer to section 3).

Then you claim that the SWD can be accurately estimated with the GNSS. In essence, you introduce the assembled STD that is used in the GNSS analysis (eq 11)

$$\text{STD}_{\text{GPS}} = \text{ZHD}_{\text{GPS}} * m_h(e) + \text{ZWD}_{\text{GPS}} * m_w(e) + m_g(e) (N \cos(a) + E \sin(a))$$

and provide the formula that you use to recover the SWD. I can only guess (please provide the details) something like this

$$\text{SWD}_{\text{GPS}} = \text{STD}_{\text{GPS}} - \text{ZHD}_{\text{NWM}} * m_h(e)$$

or better yet something like this

$$\text{SWD}_{\text{GPS}} = \text{STD}_{\text{GPS}} - \text{ZHD}_{\text{NWM}} * m_h(e) - m_g(e) (N_h_{\text{NWM}} \cos(a) + E_h_{\text{NWM}} \sin(a))$$

where  $\text{ZHD}_{\text{NWM}}$  is ZHD derived from a NWM (or derived from in situ pressure sensor) and  $N_h_{\text{NWM}}$  and  $E_h_{\text{NWM}}$  are the hydrostatic gradient components derived from a NWM. Here you can mention that the hydrostatic  $m_f$  (which is derived under the assumption of a spherically layered troposphere) takes into account the geometric bending term. In essence,

$$m_h = (\int 10^{(-6)} N_h ds + s - g) / \text{ZHD}$$

Discussion paper

With this details you are finished with 2.1 and prepared for 2.2

## 2.2 WV tomography

Since the observable you consider are SWDs, there is no need for eq 3 and 4. You can start directly with the following formula

$$\text{SWD} = \int 10^{**(-6)} N_w ds$$

and its numerical approximation

$$\text{SWD} \sim \sum_i 10^{**(-6)} N_{w_i} ds_i$$

where you again explicitly mention that, because of ray-path bending,  $s$  does not equal  $g$  (refer to section 3). Then you can proceed with your eq 6 and 7. It is important that you explain what  $P$  and  $P_c$  is. I guess (please provide the details) that  $P_c$  tells us something about the uncertainty of the observations and  $P$  tells us something about the uncertainty of the a-prior (first-guess or background) wet refractivity?

With this you are finished with section 2 and proceed with your section 3.

(3) I suggest that somewhere in the manuscript you plot the following difference

$$d\text{SWD} = \text{SWD}_T - \text{SWD}_0$$

as a function of the elevation angle for some station. Here  $\text{SWD}_0$  is the SWD calculated along the straight line path and  $\text{SWD}_T$  is the SWD calculated along the ray-path. In essence,

$$d\text{SWD} = \sum_i 10^{**(-6)} N_{w_i} ds_i - \sum_i 10^{**(-6)} N_{w_i} dg_i$$

I guess you will find that the following inequality holds true for any elevation angle

$$\text{SWD}_0 > \text{SWD}_T$$

due to the fact that the ray-path traverses the troposphere at higher altitudes than the straight line path. This would imply that when ray-path bending is not taken into account

Discussion paper

in tomography the reconstructed troposphere is too dry. To see this you could chose some 'true' wet refractivity field, say  $N_{w0}$ , and simply replace in your eq 7 the term  $(SWD - A * N_{w0})$

by

dSWD. I strongly recommend to do this somewhere in the manuscript.

technical corrections:

Abstract:

L7: '...Thereby, the ray-tracing approach itself but primarily the quality of the a prior field has a significant impact on the reconstruction quality...' improve the writing.

Introduction:

L15: 'GNSS' abbreviation not introduced here.

Section 3.1

L24: What is the 'outgoing' elevation angle? Please provide a clear definition here.

L18: The inner loop you use is to solve the so called 'homing in problem' (you make use of a shooting method). Please state this more clearly here.

Section 3.2

L4: '...In consequence, the reconstructed...'. The phrase 'In consequence' can be avoided here and at various other places.

Section 3.2.2

I suggest to show in Fig 4. directly the difference in SWD[m] and not the difference in the bending angle[arcsec]. Also, i do not find the formula for the bending angle in the manuscript. I guess you mean something like  $\arccos(v_1, v_2)$  where  $v_1$  is the tangent unit vector of the ray-path at the satellite and  $v_2$  is the tangent unit vector of the ray-path at

Discussion paper

the station?

## Section 4.1

I suggest to add in Fig 8. the difference for the a-prior (first guess or background) refractivity (ALARO). Is the radiosonde data assimilated into ALARO?
