^aFor the *t*-test, a cutoff probability level of 5% is selected; if $P < 0.05$, there is a 95% probability that the two profiles are different. For correlations, $r > 0.8$ suggests similar profiles, $0.5 < r < 0.8$ indicates a moderate similarity, and $r < 0.5$ denotes little or no similarity. The *R/U* ratio indicates the percentage of the >93 reported chemical abundances differ by more than an expected number of uncertainty intervals. The normal probability density function of 68%, 95.5%, and 99.7% for $\pm 1\sigma$, $\pm 2\sigma$, and $\pm 3\sigma$, respectively, is used to evaluate the *R/U* ratios. The two profiles are considered to be similar, within the uncertainties of the chemical abundances when 80% of the *R/U* ratios are within $\pm 3\sigma$, with $r > 0.8$ and $P > 0.05$. Species with *R/U* ratios $> 3\sigma$ are further examined as these may be markers that further allow source contributions to be distinguished by receptor measurements. They may also reflect the sampling and analysis artifacts that are not representative of the larger population of source profiles.

^bIncludes two paired samples for 2- and 7-days of atmospheric aging.

^cDegree of freedom

^d"All Fresh 2" includes fresh, unaged profiles from both Putnam (FL1) and Everglades (FL2) peats for the 2-days experiment (same as "All Fresh 7" for the 7-days experiment); "All Aged 2" includes 2-day aged profiles from both Putnam (FL1) and Everglades (FL2) peats, downstream of the oxidation flow reactor for the 2-days aging experiment (same as "All Aged 7" for the 7-days aging experiment); "All Fresh" includes combined Putnam (FL1) and Everglades (FL2) Fresh 2 and Fresh 7 peats (same as "All Aged" for Aged 2 and Aged 7 peats).
