I want to thank the referee for the positive comments and also for the very important comments that were made, and that no doubt will improve the overall quality of the paper. Indeed it is important to mention that weather conditions play a very important role in the feasibility of the measurements that we propose to do and this shall be included in the final version. Also, I believe it is true that including a small discussion on what is planned for this system would be highly beneficial. This will also be featured in the final version, so long as it does not hurt the commercial objectives that the company may have towards the system.
