

## Review of Gryspeerd, et al. - The impact of sampling strategy on the cloud droplet number concentration estimated from satellite data

I'm satisfied with the responses to the comments and the new manuscript except for a few small things as noted below.

I think that Eqn.3 is still wrong – it needs to be multiplied by  $\alpha_c$ . Presumably this does not affect the results.

Line numbers refer to the tracked changes version of the new manuscript here.

### Typos

L105 – Should be “while BR17 and Z18” rather than “which”?

L216 – “as the minimum cloud fraction....”?

L256 – Capital letter before “the 2.1um” and “which” should be “while”.

L406- “G18 has the closest match to the climatology (Fig. 6),” – not sure if I can see this from the plot? A panel for all of the campaigns combined would be useful.
