Method 1 – OP DTT assay using plate readers

Before the absorbance measurements of the samples, perform a calibration of your analytical device using a DTT calibration curve for a concentration range between 0 and 60 μ M (titration with 1mM DTNB and reading of TNB formation at 412 nm) and report the results on the Excel file provided.

19 **Reagents**:

20 Preparation of potassium phosphate (0.1M) buffer solution at pH 7.4

21 Weight 13.41 g of dipotassium phosphate (K_2HPO_4 , CAS [7758-11-4]) and 3.13 g of potassium 22 dihydrogen phosphate (KH_2PO_4 , CAS [7778-77-0]) and mix them in a volumetric flask of 1000 mL with 23 ultra-pure MilliQ water. Check the pH using a pH meter reading equal to 7.4 ± 0.1

Preparation of DTT mother solution (8.3 mM)

Weight 38.6 mg of 1,4-Dithiothreitol (DTT, CAS [3483-12-3]) and add 30 ml of the potassium phosphate buffer solution (7.4 pH). Keep the solution under an ice bath or in the fridge until use.

1.

2. Preparation of DTT daughter solution (0.25 mM)

This solution is obtained from 1.20 mL of the 8.3 mM DTT solution and completed to a final volume of 40 ml with potassium phosphate buffer solution (7.4 pH). Keep the solution under an ice bath or in the fridge until use.

3.

4. Preparation of Dinitrothiobenzoic acid (DTNB) mother solution (10 mM)

Weight 118.8 mg of 5,5'-Dithiobis (2-nitrobenzoic acid) (DTNB, CAS [69-78-3]) and add 30 ml of the potassium phosphate buffer solution (7.4 pH). Keep the solution under an ice bath or in the fridge until use.

5. Preparation of DTNB daughter solution (1 mM)

40This solution is obtained by diluting 4mL of the 10mM DTNB solution, completing a total volume of 4041mL with the potassium phosphate buffer solution (7.4 pH). Keep the solution under an ice bath or in the42fridge until use.

6. <u>Particulate Matter suspension solutions to be tested - samples</u>

- Solution SP1 5.0 μ g mL⁻¹, solution SP2 25 μ g mL⁻¹, Solution SP3 25 μ g mL⁻¹, solution SP4 25 μ g mL⁻¹.
- 45 46 47

43 44

48 Material

- 49 One transparent 96-wells plate is sufficient to process all the samples in triplicate. You can use a separate 96-wells for the calibration curve of DTT.
- 51 The samples need to be under agitation during the experiment time at 37.4°C.
- 52 An ice bath is required to keep the DTT and DTNB cold (at least keep the reagent solution fresh in the 53 freezer until use)
- 54
- 55

61 Set up the temperature of the plate reader at **37,4°C** for the duration of the assay.

1. Draw up a grid for 96-wells plate, and locate the samples SP1 to SP4 as in the table below, leaving the first 3x4 wells for the control_{ox} (inherent DTT background oxidation).

	1	2	3	4	5	6	7	8	9	10	11	12	
Α	Controlox	Controlox	Controlox	SP1	SP1	SP1	SP2	SP2	SP2	SP3	SP3	SP3	T=0
В	Controlox	Controlox	Controlox	SP1	SP1	SP1	SP2	SP2	SP2	SP3	SP3	SP3	T=10
С	Controlox	Controlox	Controlox	SP1	SP1	SP1	SP2	SP2	SP2	SP3	SP3	SP3	T=20
D	Controlox	Controlox	Controlox	SP1	SP1	SP1	SP2	SP2	SP2	SP3	SP3	SP3	T=30
Ε	SP4	SP4	SP4										T=0
F	SP4	SP4	SP4										T=10
G	SP4	SP4	SP4										T=20
Н	SP4	SP4	SP4										T=30

2. Place 20 μ L of samples SP1 to SP4 into each well and 20 μ l of ultrapure water in Control_{ox} wells.

- 3. Add 220 μ L of the potassium phosphate buffer solution (7.4 pH) in the sample wells SP1 to SP4 and in the control wells
- 4. Set up the plate reader at 37,4°C.
- 5. Place the plate into the reader and incubate for 10 minutes.
- 6. Shake the plate by the instrument for one minute.
- 7. Read the intrinsic absorbance of the samples/control at 412 nm.
- 8. At T= 0 min, program the injector A to dispense 50 μ L of 0.25 mM DTT in ALL wells. Keep the solution under an ice bath or in the fridge until use.
- At T=0 min, program injector B to dispense 50 μL of 1 mM DTNB into the T=0 wells (lines A and E). Keep the solution under an ice bath or in the fridge until use.
- 10. Shake the plate by the reader for 30 seconds every minute for 10 minutes.
- 11. At T=10 minutes, dispense 50 μ L of 1 mM DTNB into the T=10 wells (lines B and F) to stop the DTT consumption reaction by the samples.
- 12. Shake the plate by the device for 30 seconds every minute for 10 minutes.
- 13. At T=20 minutes, dispense 50 μ L of 1 mM DTNB into the T=20 wells (lines C and G).
- 14. Shake the plate by the device for 30 seconds every minute for 10 minutes.
- 15. At T=30 minutes, dispense 50 μ L of 1 mM DTNB into the T=30 wells (lines D and H).
- 16. Shake the plate for 60 seconds, wait 10 seconds and read the final absorbance at **412 nm**. The yellow compound (TNB) formed is stable for two hours; only one final absorbance measurement is necessary.
 - 17. Calculate the kinetics of the DTT oxidation as:
- nmol DTT min⁻¹ is obtained by substracting both the intrinsic absorption of each sample (to remove a potential matrix effect between samples, the value obtained in step 8) and the inherent DTT auto-oxidation rate (slope of Control_{ox} sample) from the DTT consumption rate in the presence of particles (SP1-4).
- 93 nmol DTT min⁻¹ μg⁻¹ is obtained by subtracting both the intrinsic absorption of each sample and
 94 inherent DTT auto-oxidation rate from the DTT consumption rate in the presence of particles
 95 and dividing it by the mass of particulate matter in the reaction.
- 96 % DTT consumed μg⁻¹ min⁻¹ is obtained by the % of DTT lost over the reaction with samples
 97 relative to the inherent DTT auto-oxidation and normalised by the reaction time and per μg of
 98 PM.
- 99 All these formulae are pre-included in the Excel spreadsheet provided.

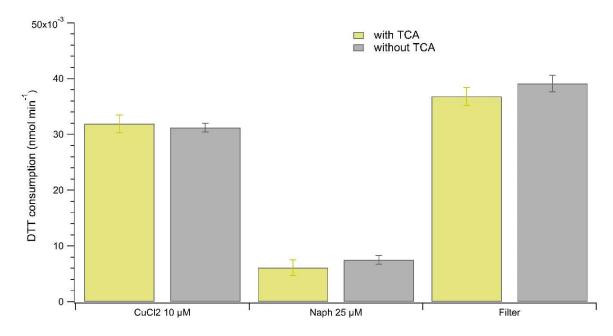

Simplified DTT RI-Urbans Protocol – CNRS

100 Use it to add the results using your participant reference number, the analytical protocol and 101 instrument used and the reference number for each sample. 102 103 Once you have reported results for the DTT simplified protocol, feel free to test the samples 104 with your own protocols, filling the other tabs of the Excel file. 105 106 107 Procedure for plate readers without injectors 108 **DTT Exposure and DTNB analysis:** 109 Set up the temperature of the plate reader at 37.4°C for the duration of the assay. 110 111 1. Draw up a grid for 96-wells plate, and locate the samples SP1 to SP4 as in the table above, 112 leaving the first 3x4 wells for the control sample (inherent DTT background oxidation). 113 2. Place 20 μ L of samples SP1 to SP4 into each well and 20 μ l of ultrapure water in Control_{ox} wells. 114 3. Add 220 µL of the potassium phosphate buffer solution (7.4 pH) in the sample wells SP1 to SP5 115 and in the control sample wells. 4. Introduce the plate into the reader and read the intrinsic absorbance of the solutions at 412 116 117 nm. 118 5. Inject 50 µL of 1mM DTNB into the T=0 min wells (lines A and E) (this is done to avoid depletion 119 of DTT with samples at t=0 with manual injection, which is slower than injectors). Keep the DTNB solution under an ice bath or in the fridge until use. 120 121 6. Dispense 50 μL of 0.25 mM DTT in ALL wells. Keep the DTT solution under an ice bath or in the 122 fridge until use. 123 7. Set up the plate reader at 37.4 °C. 124 8. Introduce the plate into the plate reader and incubate for 10 mins. 125 9. Shake the plate by the device for 30 seconds every minute for 10 minutes. 126 10. At T=10 minutes, remove the plate from the instrument and inject 50 μ L of 1mM DTNB into 127 the T=10 wells (lines B and F) to stop the DTT consumption reaction by the samples. 128 11. Place the plate back on the reader and stir it for 30 seconds every minute for 10 minutes. 129 12. At T=20 minutes, remove the plate from the reader and inject 50 µL of 1mM DTNB into the 130 T=20 wells (lines C and G). 131 13. Place the plate back on the reader and shake it for 30 seconds every minute for 10 minutes. 132 14. At T=30 minutes, remove the plate from the reader and dispense 50 μ L of 1mM DTNB into the 133 T=30 wells (lines D and H). 134 15. Place the plate back into the reader and shake it for 60 seconds, wait 10 seconds and read the 135 final absorbance at **412 nm**. The yellow compound (TNB) formed is stable for two hours; only 136 one final absorbance measurement is necessary. 18. Calculate the kinetics of the DTT oxidation as: 137 138 139 nmol DTT min⁻¹ is obtained by **substracting both** the intrinsic absorption of each sample (to 140 remove a potential matrix effect, value obtained in step 8) and the inherent DTT auto-oxidation 141 rate of the blank (slope of Control_{ox} sample) from the DTT consumption rate in the presence of 142 particles (SP1-4). 143 nmol DTT min⁻¹ μ g⁻¹ is obtained by subtracting both the intrinsic absorption of each sample and 144 inherent DTT auto-oxidation rate from the DTT consumption rate in the presence of particles 145 and dividing it by the mass of particulate matter in the reaction. 146 % DTT consumed μg^{-1} min⁻¹ is obtained by the % of DTT lost over the reaction with samples relative to the inherent DTT auto-oxidation and normalised by the reaction time and per μg of 147 148 PM. 149 All these formulae are pre-included in the Excel spreadsheet provided.

Simplified DTT RI-Urbans Protocol – CNRS

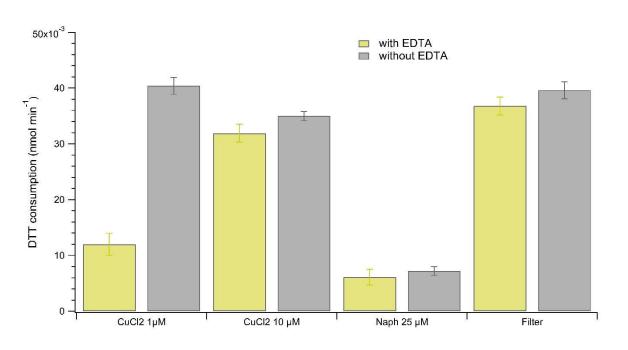

- 150Use it to add the results using your participant reference number, the analytical protocol and151instrument used and the reference number for each sample.
- 153 Once you have reported results for the DTT simplified protocol, feel free to test the samples 154 with your own protocols, filling the other tabs of the excel file.

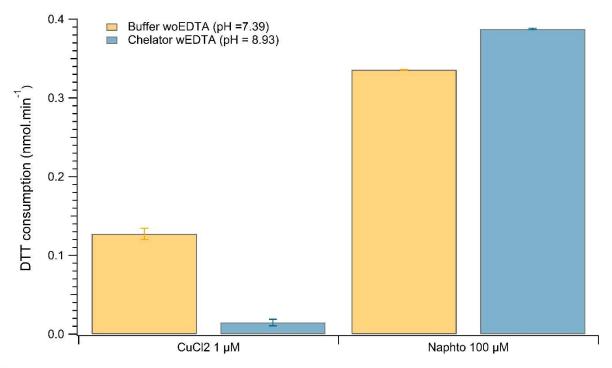

157 Figure S1. The effect of trichloroacetic acid (TCA; used for quenching the DTT reaction mixture) on the measured 158 OP DTT values (in nmol min⁻¹). The experiments were conducted using CuCl2 (10 μ M), 1,4-naphthoquinone (Naph; 159 25 μ M), and aqueous extracts of ambient PM samples (filter).

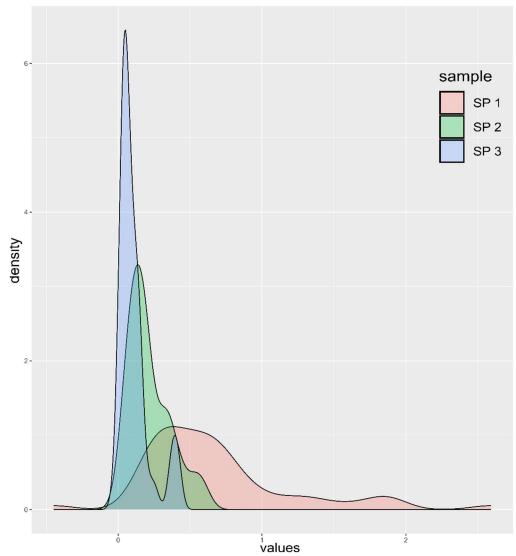

161

162 Figure S2. The average effect and standard deviation of EDTA (used for buffer purification) on the measured OP 163 DTT values (in nmol min⁻¹). The experiments were conducted using CuCl2 (1 μ M and 10 μ M), 1,4-naphthoquinone 164 (Naph; 25 μ M), and aqueous extracts of ambient PM samples (filter).

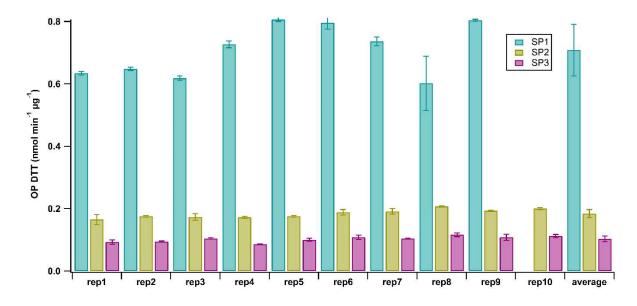

167 Figure S3. Comparison of the average effect and standard deviation of potassium phosphate buffer (pH= 7.4) 168 without EDTA (yellow bars) and the Tris-HCl buffer with EDTA (pH= 8.9) on the measured OP DTT values (in nmol 169 min⁻¹). The experiments were conducted using CuCl2 (1 μ M), and 1,4-naphthoquinone (Naph; 100 μ M) samples.
