### Second Round of Review of Manuscript AMT-2024-119 Submitted to Atmospheric Measurement Technology

Manuscript Title: Observing Atmospheric Rivers using Multi-GNSS Airborne Radio Occultation: System Description and Data Evaluation

Corresponding Author: Jennifer Haase (jhaase@ucsd.edu)

# Study Summary:

This manuscript describes the use of airborne GNSS radio occultation for observing atmospheric river (AR) events that impact the west coast of the United States. These airborne radio occultation (ARO) observations are shown to be successful in observing AR events due to the inherent ability of ARO profiles to ignore clouds and precipitation, resulting in data that can observe the thermodynamics of ARs where other remote sensing methods fail due to low vertical resolution or signal attenuation. A ARO full observation and retrieval system is described, and retrieved results were compared to ERA5 model reanalysis output as well as in-situ dropsonde observations. Mean refractivity differences between ARO profiles and ERA5/dropsonde profiles was found to be less than 0.5% magnitude above 3 km with varying standard deviation that is higher at lower altitudes, indicating the high quality of the observations and their potential usefulness in numerical weather prediction of AR events.

#### **General Comments:**

This manuscript has improved after all reviewers' comments and the authors' modifications, and I appreciate the authors' thorough responses to my comments. I would encourage the authors to add some of the information in their responses as text to the manuscript where relevant. The manuscript is still extremely valuable for its unique dataset and the information obtained from it. I think the decision to move the ARO processing description to a set of appendices was a good choice. I would also encourage additional read throughs to find any additional grammatical issues prior to publication.

# Given the state of the manuscript, I have only minor comments. I recommend publishing this paper after the below comments are sufficiently addressed.

Please see my line-by-line comments for more specific details.

# Line-by-Line Comments:

1. <u>L011:</u> I suggest removing the parentheticals surrounding the flight hours and using something like: "... obtained from 39 flights over approximately 260 flight hours by tracking multiple GNSS constellations." Not required, but I think it might help the sentence read better.

- 2. <u>L027</u>: Remove "but" from the "but prolonged heavy rainfall..." sentence, it doesn't make sense there.
- 3. <u>L035</u>: I recommend ending this sentence with "... dense horizontal sampling." and creating a new sentence with "However, ..." here.
- 4. <u>L086:</u> I am not sure if you want to specify COSMIC as COSMIC-1 or not in the manuscript. You may also provide the full name for the mission and a citation of Anthes et al., (2008) here since it is the first mention of the mission in the manuscript.
- 5. <u>L105-106:</u> I would encourage the authors to at least provide a citation for COSMIC-2 here, such as Schreiner et al., (2020).
- 6. Figure 3 Caption: "... and Galileo constellations, respectively."
- 7. <u>L395</u>: Here the authors use "COSMIC-1" but in other places the authors use "COSMIC". Please make sure the references to COSMIC-1 are consistent in the manuscript. Personally, because COSMIC-2 has launched, I would advocate for "COSMIC-1".
